Royal Tire Timmins

Subject: TLC Extreme

Royal Tire Timmins has been using the TLC product for a couple of years now, the initial benefit was to use it in our OTR wheels to minimize corrosion & extend wheel life. After using it a very short time we at Royal Tire found numerous other benefits to the product. The product assists our Tire Technicians in finding slow leaks in a tire that normally are very hard to find. (The product leaks out of the damaged tire area allowing Tire Technician to save time, minimizing down time)

Another benefit of the product we found was that after using TLC Extreme the dismantling of the tire products from the wheel assembly was so much easier. Generally very little effort is required to separate the beads from the wheel assembly thus minimizing effort from the "Bead Breaker" & allowing for quicker and safer dismantling. Royal Tire finds that the liner & bead area appear to have longer life with the TLC Extreme product keeping beads & liners lubricated. The OTR Tire Technicians want to use the product in a positive way allowing them to do their job more efficiently.

One example of TLC's benefits was when it assisted us in detecting a slow leak. Our Tire Technician inspected this tire numerous times having great difficulty finding a leak in the tire. During his inspection he took time to inspect the wheel assembly and he came across a wet spot in the barrel of the wheel and found it odd to have a damp spot on the dry wheel assembly. The Technician used a rag and wiped down the area, and noticed that the TLC Extreme was sweating through the wheel. The wheel assembly was damaged slightly and a slight wheel crack was found.

We believe the experience of our OTR Tire Technician shows the unforeseen benefit of the TLC Extreme. It allowed us to see an extremely slow leak in a cracked wheel allowing Royal Tire to take action and remove wheel from service & correcting the slow leak taking away any safety concerns with the corrective action of replacing the cracked wheel.
